## Abstract

In this paper comparative study of MDMA method and OFSTF method is discussed concluding this with MDMA is better than OFSTF for proposed pay off matrix

**Keywords:** Assignment problem, Transportation problem, Degeneracy, Pay Off Matrix (POM), Quadrants.

## I. INTRODUCTION

The transportation problem constitutes an important part of logistics management.

In addition, logistics problems without shipment of commodities may be formulated as transportation problems [1]. For instance, the decision problem of minimizing dead kilometers (Raghavendra and Maharaja, 1987) [11] can be formulated as a transportation problem (Vasudevan *et al.*, 1993; Sridharan, 1991) [18],[20]. The problem is important in urban transport undertakings, as dead kilometers mean additional losses. It is also possible to approximate certain additional linear programming problems by using a transportation formulation (e.g., see Dose and Morrison, 1996) [4].

Various methods are available to solve the transportation problem to obtain an optimal solution [16]. Typical/well-known transportation methods include the stepping stone method [2] (Charnes and Cooper, 1954), the modified distribution method (Dantzig, 1963), the modified stepping-stone method (Shih, 1987), the simplex-type algorithm (Arsham and Kahn, 1989) and the dual-matrix approach (Ji and Chu, 2002). Glover *et al.* (1974) presented a detailed computational comparison of basic solution algorithms for solving the transportation problems [6],[18]. Shafaat and Goyal (1988) proposed a systematic approach for handling the situation of degeneracy encountered in the stepping stone method [7],[8],[9],[14].

A detailed literature review on the basic solution methods is not presented. All the optimal solution algorithms for solving transportation problems need an initial basic feasible solution to obtain the optimal solution[3],[19]. There are various heuristic methods available to get an initial basic

feasible solution, such as "North West Corner" rule, "Best Cell Method," "VAM — Vogel's Approximation Method"[17] (Reinfeld and Vogel, 1958), Shimshaket *a/.*'s version of VAM (Shimshaket *al.*, 1981)[13], Coyal's version of VAM (Goyal, 1984), Ramakrishnan's version of VAM (Ramakrishnan, 1988) etc [12]. Further, Kirca and Satir (1990) developed a heuristic, called TOM (Total Opportunity-cost Method), for obtaining an initial basic feasible solution for the transportation problem [10]. Gass (1990) detailed the practical issues for solving transportation problems [5] and offered comments on various aspects of transportation problem methodologies along with discussions on the computational results, by the respective researchers.

Recently, Sharma and Sharma (2000) [15] proposed a new heuristic approach for getting good starting solutions for dual based approaches used for solving transportation problems. Even in the above method needs more iteration to arrive optimal solution. Hence the proposed method helps to get directly optimal solution with less iteration number of the proposed method [21] is given below.

## II. Transport Problem through OFSTF (Origin, First, Second, Third, and Fourth quadrants) Method

We now introduce a new method called the Transport Problem through OFSTF method for finding an feasible solution to a transportation problem. The OFSTF method proceeds as follows.

### Step 1

Construct the Transportation Table (TT) for the given Pay Off Matrix (POM).

### Step 2

Choose the maximum and minimum element in the constructed Transportation Table (TT).

### Step 3

Find the difference between the maximum and minimum element from Step 2.

If the Resultant Element (RE) matched with anyone of the element in the POM, then find the difference between each element in the Transportation Table (TT) with the Resultant Element (RE). That is,

$$\text{Maximum Element} - \text{Minimum Element} = \text{R.E}$$

If R.E = an element in TT  
 Every element in TT – R.E.

**If R.E ≠ an element in TT**

select next minimum element in TT and repeat the Step 2.3.1..

Repeat the process until the condition satisfied.

Step 4

In the Reduced POM, there will be at least one zero in the TT, select a particular zero based on the maximum deviation element from the given zeros.

Step 5

Case 1

Fix zero as origin, and find the maximum deviated element from the selected zero.

Case 2

Fix zero as origin, and find the maximum deviated element in the first quadrant (+, +) from the selected zero.

Case 3

Fix zero as origin, and find the maximum deviated element in the second quadrant (-, +) from the selected zero

Case 4

Fix zero as origin, and find the maximum deviated element in the Third quadrant (-, -) from the selected zero.

Case 5

Fix zero as origin, and find the maximum deviated element in the fourth quadrant (+, -) from the selected zero.

Step 6

Compare and fulfill the demand of the maximum deviated element with the supply in the TT.

Step 7

Calculate the total cost for each cases, the feasible solution is obtained in the origin area for all kind of transportation Problem.

Hence by observation for transportation problem, calculating the cost from origin will lead to a feasible solution through OFSTF from the following example.

**III. Example**

Consider the following cost minimizing transportation problems.

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6	8	8	5	30
S <sub>2</sub>	5	11	9	7	40
S <sub>3</sub>	8	9	7	13	50
Demand	35	28	32	25	120

Origin

Step 1

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6	8	8	5	30
S <sub>2</sub>	5	11 28	9	7	40 12
S <sub>3</sub>	8	9	7	13	50
Demand	35	28	32	25	120

Step 2

	D <sub>1</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6	8	5 25	30 5
S <sub>2</sub>	5	9	7	12
S <sub>3</sub>	8	7	13	50
Demand	35	32	25	92

Step 3

	D <sub>1</sub>	D <sub>3</sub>	Supply
S <sub>1</sub>	6	8	5
S <sub>2</sub>	5 12	9	12
S <sub>3</sub>	8	7	50
Demand	35 23	32	67

Step 4

	D <sub>1</sub>	D <sub>3</sub>	Supply
S <sub>1</sub>	6 5	8	5
S <sub>3</sub>	8	7	50
Demand	23 18	32	55

Step 5

	D <sub>1</sub>	D <sub>3</sub>	Supply
S <sub>3</sub>	8 18	7 32	50
Demand	18	32	50

Total Cost:-

$$11 \times 28 + 28 \times 5 + 12 \times 5 + 6 \times 5 + 8 \times 18 + 32 \times 7$$

$$308 + 125 + 60 + 30 + 144 + 224 = 891$$

**First Quadrant (++)**

Step 1

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6	<del>8</del> 28	8	5	<del>30</del> 2
S <sub>2</sub>	5	11	9	7	40
S <sub>3</sub>	8	9	7	13	50
Demand	35	28	32	25	120

Step 2

	D <sub>1</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6	8	<del>5</del> 2	2
S <sub>2</sub>	5	9	7	40
S <sub>3</sub>	8	7	13	50
Demand	35	32	<del>25</del> 23	92

Step 3

	D <sub>1</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>2</sub>	<del>5</del> 35	9	7	<del>40</del> 5
S <sub>3</sub>	8	7	13	50
Demand	35	32	23	90

Step 4

	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>2</sub>	9	<del>7</del> 5	5
S <sub>3</sub>	7	13	50
Demand	32	<del>23</del> 18	55

Step 5

	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>3</sub>	<del>7</del> 32	<del>13</del> 18	50
Demand	32	18	50

Total Cost:-

$$7 \times 32 + 13 \times 18 + 5 \times 7 + 5 \times 35 + 5 \times 2 + 8 \times 28$$

$$224 + 234 + 35 + 175 + 10 + 224 = 902$$

**Second Quadrant (-- +)**

Step 1

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	<del>6</del> 30	8	8	5	30
S <sub>2</sub>	5	11	9	7	40
S <sub>3</sub>	8	9	7	13	50
Demand	<del>35</del> 5	28	32	25	120

Step 2

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>2</sub>	<del>5</del> 5	11	9	7	<del>40</del> 35
S <sub>3</sub>	8	9	7	13	50
Demand	5	28	32	25	90

Step 3

	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>2</sub>	11	9	<del>7</del> 25	<del>35</del> 10
S <sub>3</sub>	9	7	13	50
Demand	28	32	25	85

Step 4

	D <sub>2</sub>	D <sub>3</sub>	Supply
S <sub>2</sub>	<del>11</del> 10	9	10
S <sub>3</sub>	9	7	50
Demand	<del>28</del> 18	32	60

Step 5

	D <sub>2</sub>	D <sub>3</sub>	Supply
S <sub>3</sub>	<del>9</del> 18	<del>7</del> 32	50
Demand	18	32	50

Total Cost:-

$$7 \times 32 + 9 \times 18 + 11 \times 10 + 25 \times 7 + 5 \times 5 + 6 \times 30$$

$$224 + 162 + 110 + 175 + 25 + 180 = 876$$

Third Quadrant (+ --)

Step 1

	$D_1$	$D_2$	$D_3$	$D_4$	Supply
$S_1$	6	8	8	5	30
$S_2$	5	<del>11</del> 28	9	7	<del>40</del> 12
$S_3$	8	9	7	13	50
Demand	35	28	32	25	120

Step 2

	$D_1$	$D_3$	$D_4$	Supply
$S_1$	6	8	5	30
$S_2$	<del>5</del> 12	9	7	12
$S_3$	8	7	13	50
Demand	<del>35</del> 23	32	25	92

Step 3

	$D_1$	$D_3$	$D_4$	Supply
$S_1$	6	8	5	30
$S_3$	<del>8</del> 23	7	13	<del>50</del> 27
Demand	23	32	25	80

Step 4

	$D_3$	$D_4$	Supply
$S_1$	8	5	30
$S_3$	<del>7</del> 27	13	27
Demand	<del>32</del> 5	25	57

Step 5

	$D_3$	$D_4$	Supply
$S_1$	<del>8</del> 5	<del>5</del> 25	30
Demand	5	25	30

Total Cost:-

$$5 \times 25 + 8 \times 5 + 7 \times 27 + 8 \times 23 + 5 \times 12 + 11 \times 28$$

$$125 + 40 + 189 + 184 + 60 + 308 = 906$$

Fourth Quadrant (-- --)

Step 1

	$D_1$	$D_2$	$D_3$	$D_4$	Supply
$S_1$	6	8	8	5	30
$S_2$	5	<del>11</del> 28	9	7	<del>40</del> 12
$S_3$	8	9	7	13	50
Demand	35	28	32	25	120

Step 2

	$D_1$	$D_3$	$D_4$	Supply
$S_1$	6	8	<del>5</del> 25	<del>30</del> 5
$S_2$	5	9	7	12
$S_3$	8	7	13	50
Demand	35	32	25	92

Step 3

	$D_1$	$D_3$	Supply
$S_1$	6	8	5
$S_2$	5	9	12
$S_3$	8	<del>7</del> 32	<del>50</del> 18
Demand	35	32	67

Step 4

	$D_1$	Supply
$S_1$	<del>6</del> 5	5
$S_2$	<del>5</del> 12	12
$S_3$	<del>8</del> 18	18
Demand	35	35

Total Cost:-

$$8 \times 18 + 5 \times 12 + 6 \times 5 + 7 \times 32 + 5 \times 25 + 11 \times 28$$

$$144 + 60 + 30 + 224 + 125 + 308 = 891$$

**MDMA Method**

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6	8/5	8	5/25	30
S <sub>2</sub>	5/35	11/5	9	7	40
S <sub>3</sub>	8	9/18	7/32	13	50
Demand	35	28	32	25	120

Step 1

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	D <sub>4</sub>	Supply
S <sub>1</sub>	6/13	8/13	8/13	5/25	30/5
S <sub>2</sub>	5/13	11/13	9/13	7/13	40
S <sub>3</sub>	8/13	9/13	7/13	1	50
Demand	35	28	32	25	120

Step 2

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	Supply
S <sub>1</sub>	6/13	8/13	8/13	5
S <sub>2</sub>	5/13	11/13	9/13	40
S <sub>3</sub>	8/13	9/13	7/13	50
Demand	35	28	32	95

	D <sub>1</sub>	D <sub>2</sub>	D <sub>3</sub>	Supply
S <sub>1</sub>	6/11	8/11	8/11	5
S <sub>2</sub>	5/11	1	9/11	40/5
S <sub>3</sub>	8/11	9/11	7/11	50
Demand	35	28	32	95

Step 3

	D <sub>2</sub>	D <sub>3</sub>	Supply
S <sub>1</sub>	8/11	8/11	5
S <sub>2</sub>	1	9/11	5
S <sub>3</sub>	9/11	7/11	50
Demand	28	32	60

	D <sub>2</sub>	D <sub>3</sub>	Supply
S <sub>1</sub>	8/9	8/9	5
S <sub>2</sub>	11/9	1	5
S <sub>3</sub>	1	7/9	50/18
Demand	28	32	60

Step 4

	D <sub>2</sub>	Supply
S <sub>1</sub>	8/9	5
S <sub>2</sub>	11/9	5
S <sub>3</sub>	1	18
Demand	28	28

Total Cost:-

$$8 \times 5 + 25 \times 5 + 5 \times 35 + 11 \times 5 + 9 \times 18 + 7 \times 32$$

$$40 + 125 + 175 + 55 + 162 + 224 = 781$$

**Comparative Study**

Comparative Study on the same problem with other methods-OFSTF Method, MDMA Method, NORTH WEST CORNER Method has been reduced.

Origin	: 891	→ 18%
First Quadrant	: 902	→ 16%
Second Quadrant	: 876	→ 18%
Third Quadrant	: 906	→ 16%
Fourth Quadrant	: 891	→ 17%
MDMA Method	: 781	→ 28%
North West Corner Method	: 1076	

**IV. CONCLUSION AND FUTURE WORK**

Thus the OFSTF method provides an feasible value of the objective function for the transportation problem. The proposed algorithm carries systematic procedure, and very easy to understand. It can be extended to

assignment problem and travelling salesman problems to get optimal solution. The proposed method is important tool for the decision makers when they are handling various types of logistic problems, to make the decision optimally and from the comparison MDMA leads the optimal solution other than all the methods.

## ACKNOWLEDGEMENT

The authors would like to thank Dr. PonnammalNatarajan, Former director of Research, Anna University, Chennai, India. for her intuitive ideas and fruitful discussions with respect to the paper's contribution and support to complete this paper.
